TIMUR
2024

DAFTAR ISI

BAB I PENDAHULUAN

1.1 Latar Belakang

Dalam era digital saat ini, pengelolaan data menjadi hal aspek yang sangat penting bagi organisasi dalam mengambil keputusan yang strategis. Data yang tersebar di berbagai sistem seringkali sulit dianalisis secara menyeluruh. Kondisi ini membuat proses analisis data menjadi tidak efisien dan menghambat pemahaman terhadap informasi. Untuk mengatasi kendala tersebut, *data warehouse* merupakan solusi yang dirancang untuk mengintegrasikan, menyimpan, dan mengelola data dari berbagai sumber. Penggunaan *data warehouse* dapat membuat data yang sebelumnya terpisah-pisah dapat dikumpulkan dalam satu tempat sehingga lebih mudah diakses dan dianalisis.

Data warehouse adalah tempat penyimpanan data perusahaan atau institusi yang terpusat dan terintegrasi, serta disusun sedemikian rupa, sehingga sangat mendukung proses pengambilan keputusan, dengan memberikan *input* pada *software* aplikasi (Wahono & Ali, 2021). Dalam *project* “Pengembangan Data Warehouse dalam Analisis Data DVD Rental” *data warehouse* dirancang untuk mengintegrasikan data dari berbagai sumber terkait penyewaan DVD, seperti informasi pelanggan, film, kategori film, staf, toko, serta transaksi penyewaan. Dengan pendekatan ini, data yang tersimpan di dalam *data warehouse* dapat diakses dan dianalisis secara efisien untuk mendukung pengambilan keputusan yang lebih baik dalam manajemen bisnis rental DVD.

DVD *rental* merupakan perusahaan yang bergerak dalam bidang penyewaan khususnya DVD. Bisnis DVD *rental* menyediakan jasa penyewaan cakram digital video (DVD) bagi pelanggan yang memiliki minat pada film namun tanpa harus membelinya. Dalam proses operasional bisnisnya, perusahaan ini memiliki data terkait dengan transaksi penyewaan, pelanggan, dan deskripsi film. Berdasarkan data-data yang dimilikinya diperlukan adanya analisis data untuk mengidentifikasi perkembangan proses bisnis yang dialami.

1.2 Rumusan Masalah

Bagaimana proses penerapan OLAP *Cube* menggunakan *tools* Mondrian pada database DVD *Rental* untuk mendukung analisis data secara multidimensional dan membantu dalam pengambilan keputusan strategis.

1.3 Tujuan

Menerapkan OLAP *Cube* menggunakan *tools* Mondrian pada database DVD Rental dengan tujuan untuk mendukung analisis data secara multidimensional yang lebih terstruktur dan efisien.

BAB II METODE

2.1 Metode Pengembangan

Metode pengembangan data warehouse dalam project ini meliputi beberapa tahap yang terstruktur untuk mendukung proses analisis data. Setiap tahap dijelaskan sebagai berikut.

2.1.1 Perencanaan

Proses perencanaan dalam pengembangan *data warehouse* dimulai dengan analisis kebutuhan data dan identifikasi struktur database. Database yang digunakan adalah database *DVD Rental*, yang terdiri dari berbagai tabel utama seperti rental, payment, customer, store, staff, date, inventory, dan film. Setiap tabel memiliki peran spesifik dalam mencatat transaksi penyewaan, data pelanggan, hingga informasi detail film. Pada tahap ini, hubungan antar-tabel dipetakan untuk memastikan data yang diperlukan dapat diintegrasikan dengan baik. Pemahaman menyeluruh terhadap sumber data ini menjadi dasar dalam perancangan skema data warehouse yang efektif dan sesuai dengan tujuan analisis. Selain itu, juga dirancang strategi untuk proses *Extract, Transform, Load* (ETL), sehingga data yang ada dapat diproses dengan optimal dan menghasilkan informasi yang terstruktur.

2.1.2 Perancangan Skema

Pada tahap ini, skema *data warehouse* dirancang menggunakan pendekatan *star schema* yang memungkinkan analisis data secara fleksibel dan efisien. *Star schema* ini terdiri dari satu tabel fakta (*fact_rentals*) dan beberapa tabel dimensi yang mendukung berbagai perspektif analisis. Sementara itu, tabel dimensi dirancang untuk memberikan detail tambahan yang relevan. Tabel dimensi yang digunakan dalam project ini terdapat *dim_customer*, *dim_date*, *dim_film*, *dim_inventory*, *dim_payment*, *dim_rental*, *dim_staff*, dan *dim_store*. Teknik *Slowly Changing Dimension* (SCD) diterapkan untuk menangani perubahan data pada dimensi tertentu. SCD tipe 1 digunakan untuk pembaruan langsung pada data yang berubah, sedangkan tipe 2 menyimpan riwayat perubahan dengan menambahkan rekaman baru.

2.1.3 Ekstraksi Data

Tahap ekstraksi data dilakukan untuk memindahkan data dari database awal ke *data warehouse*. Proses ini menggunakan alat Pentaho Data Integration (PDI) yang mendukung langkah-langkah ETL (*Extract, Transform, Load*). Pada tahap ini, data dari tabel-tabel awal seperti rental, payment, customer, store, staff, date, inventory, dan film diekstraksi, kemudian melalui proses transformasi untuk membersihkan dan menyelaraskan format data.

2.1.4 Pembuatan *Cube Mondrian* pada Tomcat

Pembuatan *cube Mondrian* dilakukan untuk mendukung analisis multidimensional pada *data warehouse*. Proses ini dimulai dengan mendefinisikan file skema XML yang menghubungkan tabel fakta dan dimensi dalam *star schema*. *Cube* ini memungkinkan pengguna untuk menganalisis data dari berbagai sudut pandang, seperti kategori film, durasi sewa, dan waktu transaksi. Setelah skema *cube* selesai dibuat, implementasinya dilakukan pada server Tomcat. Server ini berfungsi sebagai penghubung antara *data warehouse* dan *tools OLAP* seperti. Dengan adanya *cube Mondrian*, analisis data menjadi lebih fleksibel dan mendalam, memungkinkan pengguna untuk menggali informasi secara efisien dan sesuai kebutuhan.

BAB III HASIL DAN IMPLEMENTASI

3.1 Implementasi Model Multidimensi

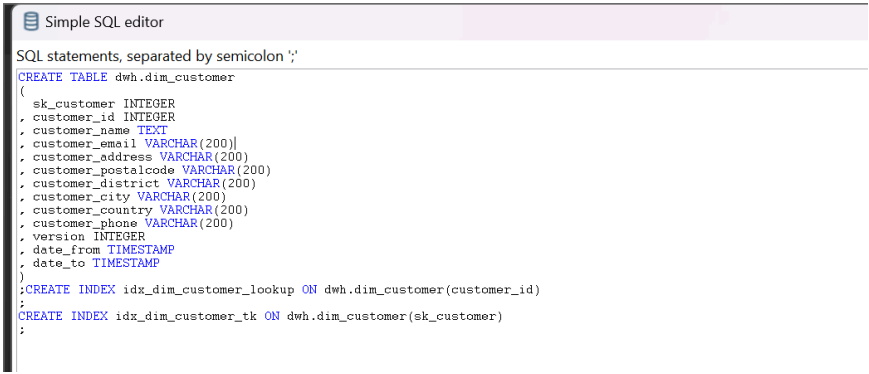

3.1.1 Skema dwh

Pada tahap awal perencanaan dalam membangun skema dwh, model yang dipilih untuk mendesain struktur data adalah *star schema*. Model ini digunakan karena mengorganisasi data secara sederhana dan mendukung analisis secara cepat dan efisien. Dalam implementasi ini, skema dwh dirancang dengan beberapa tabel dimensi yang saling terhubung dengan tabel fakta utama. Tabel-tabel dimensi tersebut memiliki peran penting dalam menyediakan konteks atau atribut pendukung yang dibutuhkan untuk analisis data. Dengan menggunakan pendekatan *star schema*, struktur data menjadi lebih terorganisir, sehingga mempermudah proses analisis mendalam dan pengambilan keputusan berbasis data. Berikut ini adalah daftar tabel-tabel dimensi yang telah dirancang sebagai bagian dari skema dwh.

1. Tabel Dimensi *Customer* (dim_customer)

Tabel “dim_customer” menyimpan informasi pelanggan untuk analisis dalam *data warehouse*. Tabel ini digunakan untuk analisis demografi, pola pembelian, dan segmentasi pelanggan guna mendukung strategi bisnis.

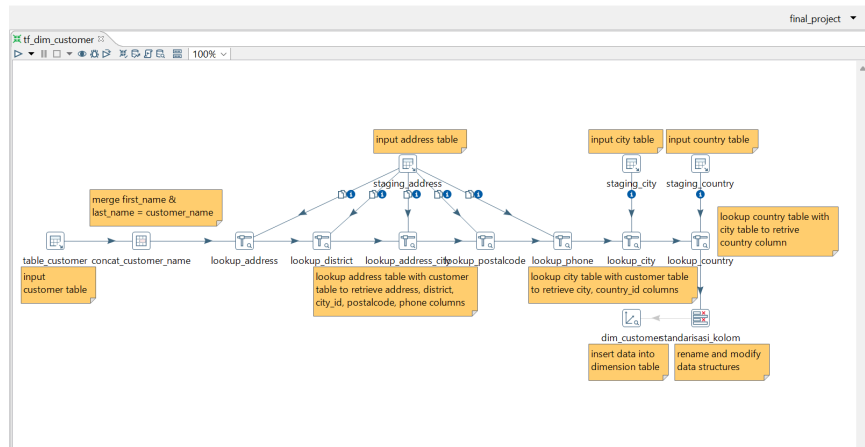

a) *Query* untuk kerangka data

```
Simple SQL editor
SQL statements, separated by semicolon ';'
CREATE TABLE dwh.dim_customer
(
  sk_customer INTEGER
, customer_id INTEGER
, customer_name TEXT
, customer_email VARCHAR(200)
, customer_address VARCHAR(200)
, customer_postalcode VARCHAR(200)
, customer_district VARCHAR(200)
, customer_city VARCHAR(200)
, customer_country VARCHAR(200)
, customer_phone VARCHAR(200)
, version INTEGER
, date_from TIMESTAMP
, date_to TIMESTAMP
)
;CREATE INDEX idx_dim_customer_lookup ON dwh.dim_customer(customer_id)
;
CREATE INDEX idx_dim_customer_tk ON dwh.dim_customer(sk_customer)
;
```

Gambar 3.18 Data Tabel Dimensi *Rental*

7. Tabel Dimensi *Staff* (dim_staff)

Tabel ini menyimpan informasi tentang staf, termasuk nama, alamat, dan lokasi kerja. Tabel ini digunakan untuk analisis kinerja staf dan manajemen sumber daya manusia.

a) *Query* untuk kerangka data

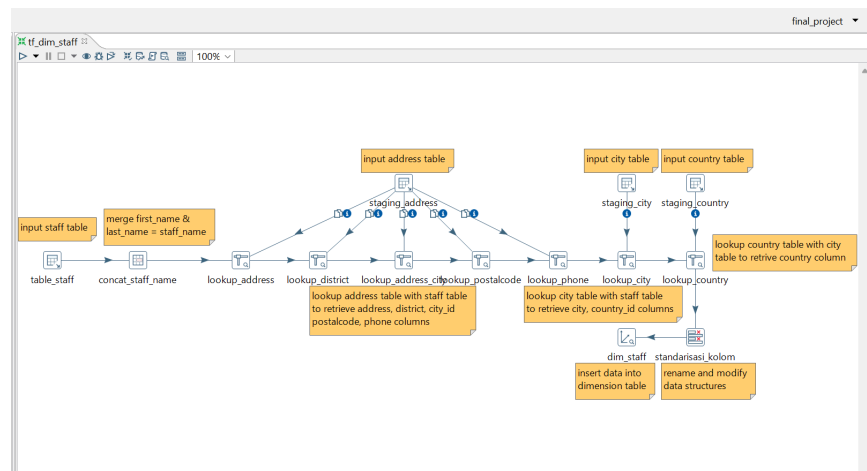

```
Simple SQL editor

SQL statements, separated by semicolon ';'

CREATE TABLE dwh.dim_staff
(
  sk_staff INTEGER
, staff_id INTEGER
, staff_name TEXT
, staff_email VARCHAR(200)
, staff_address VARCHAR(200)
, staff_postalcode VARCHAR(200)
, staff_district VARCHAR(200)
, staff_city VARCHAR(200)
, staff_country VARCHAR(200)
, staff_phone VARCHAR(200)
, version INTEGER
, date_from TIMESTAMP
, date_to TIMESTAMP
)
;CREATE INDEX idx_dim_staff_lookup ON dwh.dim_staff(staff_id)
;CREATE INDEX idx_dim_staff_tk ON dwh.dim_staff(sk_staff)
;
```

Gambar 3.19 *Query* Tabel Dimensi *Staff*

b) Proses *data warehouse* untuk penginputan data

Gambar 3.21 Data Tabel Dimensi *Staff*

8. Tabel Dimensi *Store* (dim_store)

Tabel ini menyimpan informasi tentang staf, termasuk nama, alamat, dan lokasi kerja. Tabel ini digunakan untuk analisis kinerja staf dan manajemen sumber daya manusia.

a) *Query* untuk kerangka data

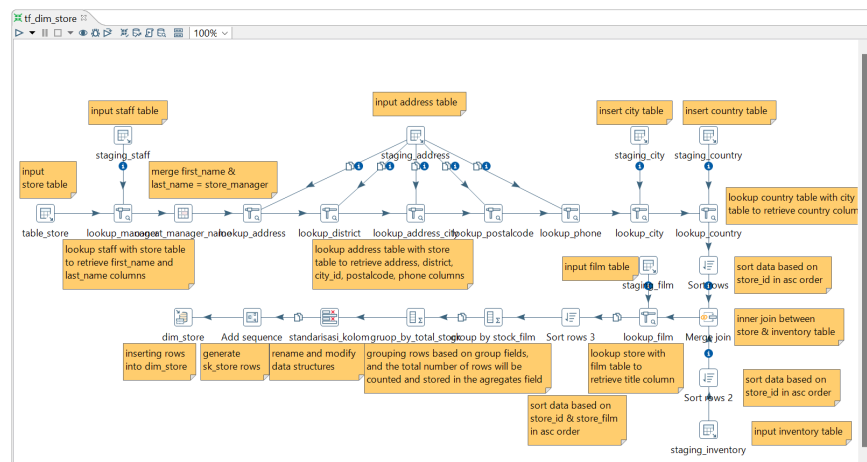

```
Simple SQL editor

SQL statements, separated by semicolon ';'

CREATE TABLE dwh.dim_store
(
  sk_store INTEGER
, store_id INTEGER
, store_manager TEXT
, film_list_inventory TEXT
, total_kind_films INTEGER
, total_stock_inventory INTEGER
, store_address VARCHAR(200)
, store_postalcode VARCHAR(200)
, store_district VARCHAR(200)
, store_city VARCHAR(200)
, store_country VARCHAR(200)
, store_phone VARCHAR(200)
)
;
CREATE INDEX idx_dim_store_lookup ON dwh.dim_store(store_id)
;
```

9. Tabel Fakta Rental (fact_rentals)

Tabel ini menyimpan data utama transaksi penyewaan, termasuk hubungan dengan tabel dimensi. Tabel ini digunakan untuk analisis menyeluruh tentang penyewaan, pembayaran, dan durasi transaksi.

a) Query untuk kerangka data

```

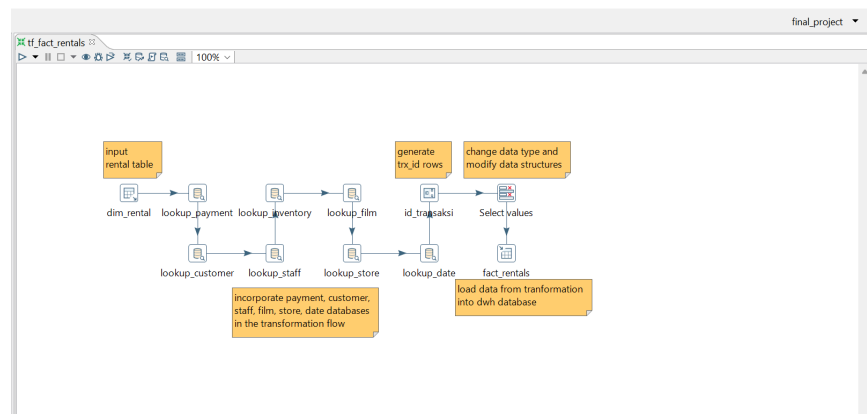

Simple SQL editor

SQL statements, separated by semicolon ';'

CREATE TABLE dwh.fact_rentals
(
  trx_id INTEGER
, sk_rental INTEGER
, sk_payment INTEGER
, sk_customer INTEGER
, sk_inventory INTEGER
, sk_film INTEGER
, sk_store INTEGER
, sk_staff INTEGER
, sk_rentaldate INTEGER
, rental_duration DOUBLE PRECISION
, payment_amount NUMERIC(9, 2)
, payment_date TIMESTAMP
)
;
  
```

Gambar 3.27 Data Tabel Fakta Rental

3.2 Implementasi *Cube* dan OLAP

3.2.1 *Cube* dan OLAP (dwh)

Pada implementasi *Cube* dan OLAP terdapat *query* dalam file Fact.xml yang digunakan untuk mendefinisikan struktur dasar *cube* OLAP yang akan digunakan dalam analisis data. Query ini memetakan hubungan antara tabel fakta (fact_rentals) dan tabel-tabel dimensi yang relevan. Setiap hubungan didefinisikan secara jelas untuk memastikan data yang dimuat ke *cube* dapat diakses secara multidimensional. File ini menjadi inti dari konfigurasi *cube*, dan memungkinkan pengguna untuk melihat data dari berbagai sudut pandang, seperti analisis berdasarkan pelanggan, film, toko, atau staf. Dengan menggunakan file ini, sistem OLAP dapat memproses data yang ada dalam *data warehouse* untuk mendukung eksplorasi data.

```
<Cube name="Fact" defaultMeasure="Amount">
  <Table name="fact_rentals"/>
```

Gambar 3.28 Query dalam File Fact.xml

Query dalam file Fact.jsp berfungsi sebagai penghubung antara *cube* Mondrian yang telah didefinisikan dalam Fact.xml dan aplikasi OLAP berbasis web. *Query* ini memungkinkan pengguna untuk menampilkan hasil analisis secara visual. Dalam file ini, berbagai operasi OLAP seperti pengambilan data, agregasi, dan pembuatan hierarki dimensi diterjemahkan ke dalam format yang dapat diakses.

```
<%@ page session="true" contentType="text/html; charset=ISO-8859-1" %>
<%@ taglib uri="http://www.tonbeller.com/jpivot" prefix="jp" %>
<%@ taglib prefix="c" uri="http://java.sun.com/jstl/core" %>

<jp:mondrianQuery id="query01" jdbcDriver="com.mysql.jdbc.Driver"
jdbcUrl="jdbc:mysql://localhost/dwh?user=root&password"
catalogUri="/WEB-INF/queries/fact.xml">

select {[Measures].[Total Amount], [Total Sales]} ON COLUMNS,
{[Customers Segmentation], [Film Rating], [Store], [Staff]} ON ROWS
from [Fact]

</jp:mondrianQuery>

<c:set var="title01" scope="session">Query SALES using Mondrian OLAP</c:set>
```

Gambar 3.29 Query dalam File Fact.jsp

Berikut ini adalah hasil dari proses implementasi tabel-tabel dimensi yang relevan ke dalam struktur Mondrian OLAP. Implementasi ini mencakup integrasi setiap tabel dimensi, seperti `dim_customer`, `dim_film`, `dim_store`, dan `dim_staff` ke dalam *cube* OLAP yang telah dirancang. Dengan implementasi ini, data dari setiap tabel dimensi dapat diakses dan dianalisis secara multidimensional, memungkinkan pengguna untuk menggali informasi yang lebih mendalam sesuai kebutuhan analisis.

1. fact_rentals (Dimensi *Customer*)

Dimensi *customer* menghubungkan tabel fakta dengan data pelanggan untuk analisis yang mendalam berdasarkan informasi demografi atau perilaku pelanggan. Hubungan antara tabel fakta dan tabel dimensi *customer* ini sangat penting untuk memberikan wawasan yang lebih personal tentang pelanggan dan mendukung strategi pemasaran yang lebih efektif.

a) Query pengisian data

```
<Dimension name="Customers Segmentation" foreignKey="sk_customer">
  <Hierarchy hasAll="true" allMemberName="All Customers" primaryKey="sk_customer">
    <Table name="dim_customer" />

    <!-- Menentukan level 1 -->
    <Level name="CustomerCountry" column="customer_country"/>

    <!-- Menentukan level 2 -->
    <Level name="CustomerDistrict" column="customer_district"/>

    <!-- Menentukan level 3 -->
    <Level name="CustomerCity" column="customer_city"/>

  </Hierarchy>
</Dimension>
```

Gambar 3.30 Query Dimensi *Customer*

b) Hasil implementasi pada Mondrian OLAP
